

Animated Pixel Cats Landing Background

You can make the cats feel animated in your landing page without using a heavy video. This approach is actually better for performance in React + Tailwind projects.

1. Add your cat PNGs

Put your transparent cat PNGs inside:

```
src/assets/
```

Example:

```
src/assets/cat1.png  
src/assets/cat2.png  
src/assets/cat3.png
```

2. Add this Tailwind animation CSS

Inside `src/index.css`

```
@keyframes floatCat {  
  0% {  
    transform: translateY(0px);  
  }  
  
  50% {  
    transform: translateY(-10px);  
  }  
  
  100% {  
    transform: translateY(0px);  
  }  
}  
  
@keyframes wiggleTail {  
  0% {  
    transform: rotate(0deg);
```

```

}

25% {
  transform: rotate(2deg);
}

50% {
  transform: rotate(-2deg);
}

100% {
  transform: rotate(0deg);
}
}

.animate-float-cat {
  animation: floatCat 3s ease-in-out infinite;
}

.animate-tail {
  animation: wiggleTail 1.5s ease-in-out infinite;
}

```

3. Add this inside your landing page

```

import cat1 from '../assets/cat1.png'
import cat2 from '../assets/cat2.png'
import cat3 from '../assets/cat3.png'

function AnimatedCats() {
  return (
    <>
      { /* LEFT CAT */ }
      <img
        src={cat1}
        alt="cat"
        className="absolute left-6 bottom-24 w-28 animate-float-cat
pointer-events-none select-none"
      />

      { /* RIGHT CAT */ }
      <img
        src={cat2}
        alt="cat"

```

```

        className="absolute right-6 top-40 w-24 animate-float-cat
pointer-events-none select-none"
        style={{ animationDelay: '1s' }}
      />

      {//* SMALL FLOATING CAT *//}
      <img
        src={cat3}
        alt="cat"
        className="absolute right-32 bottom-12 w-20 animate-float-cat
pointer-events-none select-none"
        style={{ animationDelay: '2s' }}
      />
    </>
  )
}

export default AnimatedCats

```

4. Use it in your landing page

```

import AnimatedCats from './components/AnimatedCats'

function RegisterPage() {
  return (
    <div className="relative overflow-hidden min-h-screen">
      <AnimatedCats />

      {//* YOUR LOGIN CARD *//}
    </div>
  )
}

```

5. If you REALLY want video-style animation

Use sprite sheets instead of MP4.

Why:

- lighter
- cleaner pixel-art look

- loops perfectly
- easier in React
- works great with Tailwind

You can animate:

- blinking cats
- tail wagging
- walking cats
- floating cats
- sleeping cats
- typing cats

using only CSS.

That is how most pixel-art websites and indie game landing pages do it.
